                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identifying the altered region by a combination of protein cleavage and mass spectrometry (MS). The method is used to identify any type of functional site in any type of protein but particularly ligand-binding sites and epitopes. It can also be used to investigate pathologically altered proteins or oncogenic proteins, and to inactivate target pathological proteins. The method does not require knowledge of the three-dimensional structure of (I), and is simple, rapid and automatable. It can identify non-linear or discontinuous epitopes, and determines protein function without inactivation of (I) (since the tag is bound to (A) not to (I) itself). The method may be used in vitro or in vivo for studying intra- or extra-cellular proteins. This sequence represents a mathod of the invention
                                                                                                                                                                                    Identifying functional sites in proteins, useful for detecting epitopes and ligand binding sites, by complexing with tagged binding partner, then laser irradiation to alter the protein close to the tag
                                                                                                                                                                                                                                                                                                           Ilag
               irradiating the complex (II) radicals that alter bound (I) identifying the altered region
                                                                  functional sites in a target protein (I) which comprises: (i) complexing (I) with a binding partner (A) that carries a laser-activatable tag; (ii) tradisting the complex (II).
                                                                                                                     This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                  This invention describes a novel method for identifying one or more functional sites in a target protein (I) which comprises: (i) complexing (I) with a binding partner (A) that carries a laser-activatable tag; (ii) irradiating the complex (II) formed with laser light to generate free radicals that alter bound (I) selectively at the binding sites; and (iii) identifying the altered region by a combination of protein cleavage and mass spectrometry (MS). The method is used to identify any type of functional site in any type of protein but particularly ligand-binding sites and epitopes: It can also be used to investigate pathologically altered proteins or oncogente proteins, and to inactivate target pathological proteins. The method does not require knowledge of the three-dimensional structure of (I), and is simple, rapid and automatable. It can identify non-linear or discontinuous enitones, and determines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  functional site in any type of protein but particularly ligand-binding sites and epitopes. It can also be used to investigate pathologically altered proteins or oncogenic proteins, and to inactivate target pathological proteins. The method does not require knowledge of the three-dimensional structure of (I), and is simple, rapid and automatable. It can identify non-linear or discontinuous epitopes, and determines protein function without inactivation of (I) (since the tag is bound to (A) not to (I) itself). The method may be used in vitro or in vivo for studying intra- or extra-cellular proteins. This sequence represents a UIA protein derived tryptic peptide which is used to illustrate the method of the invention.
                                                              It can identify non-linear or discontinuous epitopes, and deprotein function without inactivation of (I) (since the tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying functional sites in proteins, useful for detecting epitc and ligand binding sites, by complexing with tagged binding partner, then laser irradiation to alter the protein close to the tag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                  cc functional sites in a target protein (I) which comprises: (i) complexing cf functional sites in a target protein (I) which comprises: (i) complexing cc (I) with a binding partner (A) that carries a laser-activatable tag; (ii) ciraddiating the complex (II) formed with laser light to generate free: cradicals that alter bound (I) selectively at the binding sites; and (iii) complexing cradicals that alter bound (I) selectively at the binding sites; and (iii) command spectrometry (MS). The method is used to identify any type of command spectrometry (MS). The method is used to identify any type of complexing cradicals in the protein of protein of protein cleavage and complexing complexing the pathologically called a protein or conceptation of proteins, and to inactivate target complexing proteins. The method does not require knowledge of the cradical proteins without inactivation of (I) (since the tag is bound to complete protein function without inactivation of (I) (since the tag is bound to complete protein function without inactivation of (I) (since the tag is bound to complete protein derived tryptic peptide which is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

cc infection by an acid-resistant microorganism (A) by treating a faccal comple with at least two different monoclonal antibodies (MAb) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting cc formation of a complex (C) between (I) and the corresponding antigen of CC (A). The first and second (I) bind to epitopes of different antigen of CC (A). These epitopes are present, after passage through the intestines, CC in at least some mammals, and have either: (1) their native structure; CC infected or immunized with (A), or its extract, lysate, derived protein CC infected or with a synthetic peptide. Practically all mammals display or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect complexive and campylobacter, specifically H. pylori, H. hepaticus, Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, CC witherapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This complementarity determining region CDR3 which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        H. pylori 26 kDa protein-binding antibody heavy chain CDR3 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Unidentified.

                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel method for identifying one or more C functional sites in a target protein (I) which comprises: (1) complexing C(I) with a binding partner (A) that carries a laser-activatable tag; (ii) cradiating the complex (II) formed with laser light to generate free CC radicals that alter bound (I) selectively at the binding sites; and (iii) C identifying the altered region by a combination of protein cleavage and CC mass spectrometry (MS). The method is used to identify any type of CC functional site in any type of protein but particularly ligand-binding CC sites and epicopes. It can also be used to investigate pathologically CC altered proteins or oncogenic proteins, and to inactivate target three-dimensional structure of (I), and is simple, rapid and automatable. CC tran identify non-linear or discontinuous epitopes, and determines CC protein function without inactivation of (I) (since the tag is bound to CC (A) not to (I) itself). The method may be used in vitro or in vivo for Studying intra- or extra-cellular proteins. This sequence represents a complete continuous determines of the invention derived tryptic peptide which is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an isolated, breast cancer-associated polypeptide detectable at a higher concentration in serum of a human without breast cancer than in serum of a human without breast cancer and that he will breast cancer than in serum of a human without breast cancer and that he will be breast cancer associated protein is used in an anti-sense or binding protein. Concer-associated protein is useful for the sase of the protein in breast cancer associated protein in by the protein in breast tissue, blood, serum, plasma, sweat, concer in an individual, by the protein in breast tissue, blood, serum, plasma, sweat, concers, urine, peritoneal fluid, lymph, vaginal secretions, semen, spinal contents, ascitic fluid, saliva, sputum or breast exudate isolated from the individual. The breast cancer associated proteins permit a rapid content of the present sequence is a tryptic peptide of human U2 small nuclear concersus permit a reportein B (U2 snRNP B). U2 snRNP B is a breast cancer associated marker protein which has binding affinity to a nickel surface-enhanced laser desorption and ionisation (SELDI) chip. The peptide is obtained from U2 snRNP B by proteolysis with trypsin.
                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                       5
                                                                                                                                                                                                                                                                                                                                          The present invention relates to marker molecules indicative of disease in mammals which are identified using a new method in which an abundant protein is removed from a sample to enable less abundant molecules to be evaluated as possible markers, the sample is then fractionated and if fractions analysed by known mass spectroscopy techniques and results compared between individuals with and without the disease. The method is useful for identifying disease markers in mammals, especially humans, cespecially markers for cancer, such as breast, lung, prostate, bladder, cervical, ovarian, colon or colorectral cancer. Once identified, the markers can be used as targets in assays for detecting the disease and in disease treatment e.g. administration of antibodies binding to and celiminating/reducing activity of the target protein in vivo. The present sequence is a tryptic peptide of human U2 small nuclear ribonucleoprotein B (U2 snRNP B) which is used in the invention. The peptide is obtained from U2 snRNP B by proteolysis with trypsin.

Note: The present sequence is also shown in sequence listing of the specification, but lacks an amino acid in the N-ternimal end and in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel antibodies that immunospecifically bind the Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TWF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity may be activity and sentiate and anti-time activity and activity and anti-time activity and activity

                                             cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletion in a patient's genome that affect the activity of P by expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a NE-dlg molecule. The present invention describes human discs large 1 gene (dlg) family expressible in nerve tissue. Also described are: (1) a polynucleotide (PN) encoding dlg and comprising a 3100 (I) or 3213 bp (II) sequence; (2) RNA corresponding to PN having sequences (I) and (II), (3) RNA having a base sequence translated by dlg; (4) an antisense PN having a t least 15 bp sequence and which is a part of PN of (1); (5) a derivative of the antisense PN; (6) an antibody specific for dlg, and (7) an antibody specific for a polypeptide having a 817 or 849 as sequence. The polypeptide, RNA's and antibodies can be used for detection of dlg. The antisense PN can be used as a therapeutic composition for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                            Nucleic

                                                                                 The present invention relates to TANGO or INTERCEPT proteins and coding sequences (see ARF45121-F45136 and ARF45138-F45139 and ARB66031-B66057, ARB66064-B66083 and ARB66085). The TANGO/INTERCEPT proteins and coding sequences are useful for the treatment of neurological disorders such as central nervous system (CNS) disorders, CNS-related disorders, focal brain disorders global-diffuse cerebral disorders and other neurological and cerebrovascular disorders. The CNS disorders include Alzhelmer's disease, senile dementia, Huntington's disease, amyotrophic lateral sclerosis, Parkinson's, Gilles de la Tourette's syndrome, autonomic function disorders such as hypertension and sleep disorders, autonomic function disorders such as hypertension and sleep disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TANGO and INTERCEPT nucleic acids, proteins, and antibodies, useful for screening assays and diagnostic assays and for the treatment of neurological diseases such as Alzheimer's, Parkinson's and Huntington's

CC D-amino acid histatin 2, found in human paratiol secretion, where at CC least one amino acid in the peptide is in the D-configuration. The CC peptide is preferably modified by an acetyl or carbamyl addition at the C-terminus and/or amidation at the C-terminus. The novel D-amino CC acid-containing peptide, based on the naturally occurring histidine-CC rich human histatins, have anti-fungal and anti-bacterial activity and CC are useful in compositions for the treatment of oral, vaginal, urethral, CC mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial cC canida albicans infection, against oral bacterial diseases such as CC caries and periodontitis (by inhibiting e.g. Streptococcus mutans and CC porphyromonas gingivalis) and against Clostridium histolyticum. The D-CC amino acid-containing peptide has superior anti-fungal (especially canti-candidal) and anti-bacterial activity, particularly on a weight basis, compared to the natural L-amino acid forms of histatins and CC histatin-based peptides. The presence of D-residues also makes the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The present sequence represents histatin 2, found in human paratoid secretion, where at least one amino acid is in the D-configuration. The peptide preferably is modified by an acetyl or carbamyl addition at the N-terminus and/or amidation at the C-terminus. The peptide, based on the naturally occurring histidine-rich human histatins, have anti-fungal and anti-bacterial activity and are useful in compositions for the treatment of oral, vaginal, urethral, mucosal, respiratory, skin, ear and ophthalmic fungal or bacterial infections. It is particularly effective against local and systemic Candida albicans infection, against oral bacterial diseases such as caries and periodontitis (by inhibiting e.g. Streptococcus mutans and Porphyromonas gingivalls) and against Clostridium histolyticum. The peptide has
                                                                                                                                                                                                                                                                                                                                                    07-JUN-1995;

 pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                    Score

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                       Score
